Integrative Procedures in Facial Rejuvenation-Seyed Omid Keyhan 2021-07-20 Physical attractiveness of the face has a significant impact on the social life and mental health of individuals. Aesthetic procedures can help improve the patient’s current and desired facial features from the perspective of both soft and hard tissues. Significantly greater changes to facial aesthetics can be made via facelifts, rhinoplasty, labiaplasty, blepharoplasty, rhinoplasty, liposuction, and various other surgical procedures. These procedures can be performed as part of a comprehensive plan to address multiple areas of the face, resulting in a more balanced and harmonious appearance. The use of minimally invasive techniques, such as endoscopic procedures, allows for more precise and controlled treatment, minimizing downtime and recovery time.

Mohs Micrographic Surgery - Stephen N. Snow 2004 Molar MicroGraphic Surgery: an advanced treatment procedure for skin cancer, offers the highest potential for recovery—even if the skin cancer has been previously treated. This procedure is most often used in treating two of the most common forms of skin cancer: basal cell carcinoma and squamous cell carcinoma. The cure rate for Mohs Micrographic Surgery is the highest of all treatments for skin cancer—up to 99 percent even if other forms of treatment have failed. Anterior Skull Base Tumors - Nicola 2020-12-07 In recent years, interest in the management of anterior skull base tumors has been fostered by the introduction and subsequent rapid expansion of indications of transnasal endoscopic techniques. In parallel, extraordinary progress has been made in all the other disciplines which are involved in the complex process of managing anterior skull base tumors, leading to substantial improvements in diagnosis and treatment. The anterior skull base can be involved in a large variety of tumors of a varying nature and histology, which in the majority of cases originate from adjacent anatomic sites. In fact, primary lesions of the anterior skull base mainly include osteomas and other tumors originating from bone and cartilage. Tumors involving the anterior skull base have their origin prevalently in the sinonasal tract, but lesions developing on the intracranial site, such as meningiomas, may also extend caudally to encroach upon this area. All those lesions are rare, which means that the pertinent literature does not include prospective studies or treatment guidelines based on a high level of evidence. In view of the extreme histological variability of lesions involving the anterior skull base, much emphasis has been placed on addressing the different nuances of treatment in relation to histology, especially for malignant tumors. The chapters focusing on surgery provide divergent views on selection criteria for a specific surgical technique, which is the aim of this publication.
